How do i set the time zone on my lacrosse atomic clock

Our Radio Controlled clocks, watches and weather stations receive an embedded radio signal from the Atomic Clock in Ft. Collins, Colorado that tells the product to change to or from Daylight Saving Time. Radio signals are subject to atmospheric and other types of interference. The signal is best received at night. The antenna in your clock, watch or weather station is directional. It is not unusual for it to take 3-5 nights for signal reception to occur depending on location. Watch antennas are much smaller, so please allow extra time for them to change. How can I improve reception? Have good plain alkaline batteries dated 7 years in advance or batteries that have been tested with a voltmeter reading 1.48 or higher. Batteries are the #1 warranty issue we see. At night, place the clock, watch or weather station on a wall or in a window with the Front or Back facing Ft Collins Colorado. This allows the widest portion of the antenna to be positioned to receive the signal. Be sure you have the correct Time Zone set on your device. If your clock, watch or weather station is not set to a North American time zone, it may not change for DST. Atlantic - ATL -4 Eastern - EST -5 Central - CST -6 Mountain - MST -7 Pacific - PST -8 Alaskan - ALA -9 Hawaiian - HAW -10 If your clock, watch or weather station has a DST OFF feature, please be sure to have it turned ON. (Default is ON). If your clock, watch or weather station has an ATOMIC OFF, RCC OFF or WWVB OFF feature, please be sure to have it turned ON. What should I do if the time hasn't changed? Please allow 3-5 nights for your Clock, Watch or Weather station to correctly change for the start of DST before contacting us. Often it is just an interference issue that will resolve on its own. Product specific information can be found by using the magnifying glass at the top of this screen. If the time has not set after 5 nights, please contact customer support using the below link. Need More Help? Contact Us Here Atomic clocks are the most accurate timepiece you can own. Because of the way they operate and how well they run, you can depend on their precision. You rarely have to set them yourself. When the clocks are changed during the fall and spring, the work is already done. How an Atomic Clock Operates Sometimes called radio controlled clocks, atomic clocks are set and run from a signal originating from Fort Collins, Colorado. The signal is sent from a transmitter at the National Institute of Standards and Technology. An antenna and receiver on each clock allow it to receive the signal. The first thing you will have to do is select the correct time zone that you are located in. The clocks do adjust for daylight saving time. If you live in an area that does not participate in the daylight savings time change, you will have to disable the clock for that period or make the adjustment after the clock has updated. How to Set Time on an Atomic Clock If there is a glitch in the signal and your atomic clock is no longer accurate, you can take steps to set it yourself manually. Start with a search for an online atomic clock instruction manual. You should be able to find the information by conducting a search on the Internet for "How to set time on an atomic clock." Who Makes Atomic Clocks There are a few manufacturers that make the atomic clock models, with the most notable brands being Howard Miller, Seiko, Bulova and La Crosse. Each clock should have a default button on the back so that the clock can be set manually. Most operate on battery power. Benefits of an Atomic Clock Sometimes, the clock may have time that isn't accurate. This can happen if it is located in a place that does not pick up a clear signal because something is blocking it, or it is facing in a location that doesn't create a path for the transmission. The time on the atomic clocks is so accurate that they are synced with other electronics like computers, smartphones and other precise ways to tell time. Where to Purchase an Atomic Clock Atomic clocks can be purchased most places that carry any other timepieces. Retail stores and jewelry stores and other places that carry clocks and watches will most likely have an atomic clock or two in stock as well for purchase. If you tell them that is what you are interested in, they should be able to suggest a model based on your information. They can be found in tabletop models, wall models and trustworthy accurate alarm clocks. MORE FROM QUESTIONSANSWERED.NET Have you ever wanted to know the time and date in Chicago so you can phone home while vacationing in the UK? Calculating time zone differences is relatively straightforward, and it's a helpful trick to know for anybody who travels a lot but likes to keep in touch with family. Calculating Time Using World Time Zones The world is divided into 24 equal sections based on meridians of longitude, so they're each 15 degrees apart. Each line you cross differs from the previous line by one hour, so if you travel east, each longitude line you cross is one hour later than the previous line. On the other hand, if you travel west, the space between each longitude line you cross over is one hour earlier than the previous line. This division of time sometimes complicates international travel. For example, you could decide to phone home bright and early in the morning during your vacation to England to find that not only is it night back home but it's also a different date. Understanding Universal Time Fortunately, there's a unified way of determining the time anywhere in the world. Coordinated Universal Time, usually called UTC or just UT, is a way of representing time consistently across the time zones. UTC is based on the time at the 0-degree longitude meridian, which runs through Greenwich, England (previously known as Greenwich Mean Time, or GMT for short). This means that universal time is effectively the current time in England. Converting Universal Time to Local Time Knowing that UTC is based on the time in Greenwich, England, means it's possible to convert it to local time by using the different time zones. For example, if the UTC time is 14:00 on the 24-hour clock, and you live two time zones to the east, you know that your local time is 16:00 (UTC plus two hours). If you live four time zones to the West, you know that your local time is 10:00 (UTC minus four hours). Using an Online Time Converter Having access to the internet means that the answers to common problems are never more than a mouse-click away. There are plenty of online time converters, such as the Time and Date website, that are free to access and use. These sites make it easy to determine the time anywhere in the world. Simply enter a location or time zone to calculate relative time differences instantly. For globetrotters, having such online resources available on a phone makes traveling much easier. What is UTC Used For? Having a single coordinated time is particularly useful in any applications involving international trade and transit. For example, UTC helps in the organization of intercontinental freight transportation, train services, aviation, weather, astronomy, scientific research and military operations. Of course, for most people, it's just a useful way of making sure they don't accidentally wake up mom and dad when they phone during a European vacation. MORE FROM QUESTIONSANSWERED.NET CCO/jarmoluk/Pixabay If you board a plane in New York at 3 p.m. and head west, you land in San Francisco at 6:40 p.m. despite the fact that you were in the air for almost seven hours. As you crossed the country, you went back in time—or so it seems. In a way you did. During your flight, you went from one time zone into another. To understand how this works, you need to know how to convert between time zones. Understanding Time Zones When people talk about time zones, they're referring to the way people adjust the clock as they move toward or away from Coordinated Universal Time (UTC). Time advances one hour for every 15 degrees east you move from the Prime Meridian in Greenwich, London. Each one hour increment represents a time zone. When you arrived in San Francisco at 6:40 p.m., it was also 9:40 p.m. on the New York time clock. Why Did Countries Start Using Time Zones? Time zones are a relatively recent invention. People used to tell time by the position of the sun. Each community set the official clock at noon when the sun reached its highest spot in the sky. As a result, noon in Washington, D.C. took place before noon in Chicago. When people started using the railroad to travel and transport goods across the United States, they found local times confusing. It was difficult to coordinate train schedules. The solution was to divide the country into four time zones: eastern, central, mountain and pacific. Within each region, all the clocks displayed the same time. Universal Coordinated Time In 1884, representatives from select countries met at the International Meridian Conference in Washington, D.C. During the conference, the members decided to designate the line of longitude that passes through Greenwich, England, as the Prime Meridian. This imaginary line became the standard for Coordinated Universal Time (UTC). The world uses UTC to regulate clocks. Some people use the terms Coordinated Universal Time and Greenwich Mean Time (GMT) interchangeably, but they are not exactly the same. UTC is the time standard. GMT is a time zone that includes parts of Europe and Africa. How Many Time Zones Are in the World? Since there are 24 hours in a day, it makes sense to have 24 time zones in the world. There are, however, more than 30 time zones across the globe. Some of these time zones have increments of 30 minutes or 45 minutes, but most of them represent one hour. Time zones don't follow a straight line from north to south. In some countries, the time zone border follows the country's political border. Other countries, like China, have only one time zone. If you look at a map of the world's time zones, you see jagged lines where they adjust to accommodate these countries. Calculating Time Differences Calculating time differences is fairly simple and requires basic addition and subtraction. You add as you move east and subtract as you move west. Eastern Standard Time is five time zones west of Greenwich Mean Time, so you subtract five hours from UTC to determine the time in New York. Japan Standard Time is nine time zones east of Greenwich Mean Time, so you add nine hours to UTC to calculate the time in Tokyo. For example, if you're in Los Angeles and want to know what time it is in Paris, you count the number of time zones between the two cities. There are nine time zones between them. When it's 1:00 p.m. in Los Angeles, it's 10:00 p.m. in Paris. The exception to this is a time zone with a 30- or 45-minute increment. Daylight Saving vs. Standard Time Benjamin Franklin came up with a plan to change time on the clock and move it ahead one hour in the summer. This gave him an extra hour of natural light in the evening, so he wasted less fuel on lighting. More than 100 years later, the United States adopted Daylight Saving Time as a way to conserve energy during World War I. The United States isn't the only country to observe Daylight Saving Time. Most countries in North America, Europe and parts of South America and Australia switch to a form of Daylight Saving Time during the summer. This also makes it more difficult to convert between time zones, so many people use a time zone calculator when they need to know what time it is in another part of the world.
